1	.2.	Auto-Updating vCenter Data in NetBrain through Benchmark	. 6

1. Setting Up VMware Virtual Networks

The NetBrain system provides end-to-end visibility for VMware vCenter network resources as well as their physical and virtual relationships. With NetBrain, you can quickly understand a vCenter network in the following aspects:

- What you have in your vCenter network, such as ESXi hosts, VM hosts, virtual switches.
- The detail information about a vCenter network node, such as properties.
- The network design between vCenter network nodes, such as Layer 3 connection of VM hosts and their gateway devices, and the (parent/child) relationship between an ESXi host and vSwitch/VMs under the host.

Example: A Visualized Layer 2 Topology of a VDS

1.1. Discovering vCenter Data in NetBrain Domain

<u>Prerequisites</u>: A user account with the minimum **read-only** role is required to enable NetBrain to discover a vCenter network.

Note: Ensure to check the option 'Propagate to children' when you create the Read-only account.

$+ \mathscr{I} \times$				
т	Role T	Defined In		
	Administrator	₽ 192.168.31.242		
	Administrator	Global Permission		
	AutoUpdateUser	Global Permission		
	Read-only	This object and its children		
	Read-only	This object and its children		
	Administrator	Global Permission		
	Administrator	Global Permission		
	vSphere Client Solution User	Global Permission		
	Ŧ	Role Role Administrator Administrator AutoUpdateUser Read-only Read-only Administrator Administrator Administrator VSphere Client Solution User		

To understand a VMware vCenter network, you need to first discover the network data model in a NetBrain domain.

1. Add a vCenter Controller

NetBrain retrieves VMware vCenter data through the vCenter Controller by using APIs. Follow the steps below to add a vCenter Controller and specify the address and user credentials to access the controller in the system.

1) Click the domain name from the quick access toolbar and select **Manage Domain**.

		~ A	💄 admin 🌘			
Current Domain: Manage Domain						
Tenant: Initial T	enant 👻		Search	Q 🕃 Refresh		
Tenant Name	Domain Name	Maximum Nodes	Description	Creator		
Initial Tenant	ENG-63288	1000 (9 used)		ashuan -		
Initial Tenant	107	100000 (1670 used)		cashuan		
Initial Tenant	auto50%Domain	10000 (169 used)	Script created t	admin		
Initial Tenant	auto?estCoMap	100000 (124 used)		cashuar 🗸 🗸		
New Domain			Cancel	Apply		

 In the Domain Management page, select Operations > Discover Settings > API Server Manager from the quick access toolbar.

3) Click Add on the API Server Manager tab.

Edit External API Server			
Server Name:	Vcenter1		
Description:			
API Source Type:	VMware vCenter		~
Endpoints:	https://		
Username:	Password:		
Front Server/Front Server Group:	P\$3251(10.10.32.51)		\sim
Advanced ∨ Managed Devices: 0			
Test		Cancel OK	

- 4) Enter a unique name in the **Server Name** field.
- 5) Select VMware vCenter from the API Source Type drop-down menu.
- 6) In the **Endpoints** field, enter the URL of the vCenter Controller.
- 7) Enter the username and password to access the vCenter Controller. If more parameters are required when you access the vCenter Controller, you can click **Advanced** to configure the keys (parameter names) and values.
- 8) Select a Front Server or Front Server Group.

Note: Make sure that the port 7068 of the server where your NetBrain Front Server is installed is not occupied by other applications because this port is used by service components of a Front Server to communicate with each other.

9) Click **OK**.

2. Discover Your VMware Virtual Network

- 1) In the Domain Management page, select **Operations > Discover** from the quick access toolbar.
- 2) Click Select API Servers and select Venter1 that you have configured.

3) Click Start Discovery.

S VM		VDS				
VM Host	vSphere Standa	vSphere Distrib				
33	3	3				

Note: The SDN discovery only retrieves basic data of your network and builds L3 topology. After the discovery, you need to execute a benchmark task to retrieve all data and build all components, including visual spaces and data views. See <u>Auto-Updating vCenter Data in NetBrain through Benchmark</u> for details.

1.2. Auto-Updating vCenter Data in NetBrain through Benchmark

The discovery only retrieves basic data of your vCenter network and builds L3 topology. After the discovery, you need to execute a benchmark task to retrieve all data and build all components, including visual spaces and data views.

Example: Benchmark VMware vCenter in a NetBrain Domain.

- 1. On the Start Page, click **Schedule Task**.
- 2. On the Schedule Discovery/Benchmark tab, click Add Benchmark Task.
- 3. On the **Frequency** tab, define the task frequency.

4. On the **Device Scope** tab, check the **Select external API servers to retrieve data of SDN nodes** check box, and select a vCenter server.

Frequency Device Scope Retrieve Live Data CLI Cor	nmands	Additional C	Operations after Bench	mark Plugins	Summary	
Select Device		Select external API servers to retrieve data of SDN nodes				
All Devices Device Group Site		API Source Type	Server Name	Endpoint	Description	
Load Palancer(1)		VMware vCenter	Vcenter1	https://		
Coad Balancer(1)		VMware NSX-V	NSX	https://		
Unclassified Device(1)						
L3 Switch(13)						
👸 Router(6)						
💋 Firewall(5)						
1 End System(26)						

5. On the **Retrieve Live Data** tab, select the **VMware vCenter** checkbox.

6. On the **Additional Operation After Benchmark** tab, select all the check boxes in the **Build Topology** and **Rebuild Visual Space** areas.
